

MARCH 4 – RECAP + USING LLMS FOR CODING

DISCUSSION OF API AND CODING ASSIGNMENT (FROM LAST WEEK)

DISCUSSION OF PAPER ON SKILL FORMATION AND AI

(AGENTIC) AI-ASSISTED CODING HOMEWORK FOR MAR 9 (POSSIBLY TBC)

Here are two exercises that I used to give as final projects for my undergraduate Machine Learning class. You can find them here (**note: only one is publicly available**):

https://drive.google.com/drive/folders/I_LUskfYxL2plpBR4GqOXNPn5oJi6rVuP?usp=sharing

Your task will be to pick one and implement it, using agentic AI (recommended if you are already familiar with the web interface; this gives the AI access to your codebase) or simply by using LLMs as assistants to understand and debug code.

Agentic AI options: Antigravity from Google (seen on Monday), CODEX from OpenAI (currently free with any account, I believe, but it can also be used with an API key; you are welcome to use the one I provided!), or Claude CODE (can also be used with an API key, again please go ahead!)

Please post a Google Drive link with your solution files.

RECOMMENDATIONS/LESSONS LEARNED (IF USING AGENTS)

- One of the two exercises has a “Starter Code” notebook; ask to make a copy instead of modifying it directly
- I found that both Codex and Antigravity had trouble with using a non-standard Python kernel, maybe due to my own ignorance; I found it easier to run the notebook myself
- My experience was that Codex (GPT 5.2 Codex– Medium) was far superior to Antigravity (Gemini 3.2 Pro, I believe) in solving the pCO₂ exercise. Gemini got stuck with trivial errors (how many plots) and each iteration took forever. Again, this may be due to my poor mastery of the tools. But I’d be curious to see your experience.
