

MARCH 30 – POLICIES IN AI FOR WRITING

AI IN WRITING AND REVIEWING

Use of AI in writing and reviewing papers and proposals: sources

Paper 1: Towards responsible generative AI in academia: a synthesis of AI policies on academic writing in the field of educational research

AI and Ethics (2025) 5:5467–5484

<https://doi.org/10.1007/s43681-025-00794-6>

Paper 2: Artificial intelligence-assisted academic writing: recommendations for ethical use

Adv Simul **10**, 22 (2025).

Paper 3: Use of Generative AI in Scholarly Research: Challenges and Opportunities

Communications of the Association for Information Systems, Atlanta, Vol. 58, (2026): 36.

<https://www.proquest.com/openview/940a2d9d55cc56c449ce2f40f1f6d8bf/1.pdf>

BANNING USE OF AI IS GENERALLY CONSIDERED OBSOLETE

- Although some panelists regretted that AI and GAI had ever been invented, the consensus was clear: such a restriction is no longer practical, as AI and GAI tools are already deeply integrated into many people's daily lives. (Paper 3)

AUTHORSHIP AND HUMAN ACCOUNTABILITY

- Most editors and publishers agree that AI cannot be an author of a publication because it doesn't meet consent/accountability requirements (note: this is not a statement about intellectual contribution).

Committee on Publication Ethics

<https://publicationethics.org/guidance/cope-position/authorship-and-ai-tools>

- The use of artificial intelligence (AI) tools such as ChatGPT or Large Language Models in research publications is expanding rapidly. COPE joins organisations, such as WAME and the JAMA Network among others, to state that AI tools cannot be listed as an author of a paper.
- AI tools cannot meet the requirements for authorship as they cannot take responsibility for the submitted work. As non-legal entities, they cannot assert the presence or absence of conflicts of interest nor manage copyright and license agreements.

DISCLOSURE

- Disclosure is widely acknowledged as a necessity and generally (but not always) enforced.

Table 3 Coding scheme, definition, and example quotes from AI policies

Codes	Definition	Quotes
L1a: DISCLOSURE	Policy guidelines that describe the requirement for authors to disclose and properly acknowledge the use of generative AI	<i>Authors are required to clearly indicate the use of language models in the manuscript, including which model was used and for what purpose</i> (Association for Psychological Science - Academic Association) <i>The use of content generated by artificial intelligence (AI) in an article (including but not limited to text, figures, images, and code) shall be disclosed in the acknowledgments section of any article submitted to an IEEE publication</i> (IEEE - Publisher) <i>Proposers are encouraged to indicate in the project description the extent to which, if any, generative AI technology was used and how it was used to develop their proposal</i> (National Science Foundation - Federal Agency)

paper 1

that this has to be a living document where we take research and input

3.5 How can one detect AI in research?

paper 3

The development and promulgation of guidelines, policies and statements on the use of AI in research is certainly a positive first step. However, their effectiveness ultimately depends on the honesty and integrity of authors, without which the guidelines would serve little purpose. Therefore, transparency is essential to foster trust in the ethical use of AI in research. Editors were very clear and “united” on this point. One said the following:

“You need to disclose whether you're using it [AI] just for proofreading or reference checking. The author has to be responsible. So they have to be trustworthy and honest.”

PROPOSED ETHICAL USE CHECKLIST (PAPER 2)

Author checklist—key considerations for the ethical use of generative AI tools in manuscript writing

PROPOSED TAXONOMY OF ETHICAL GEN AI USE (PAPER 2)

Fig. 2 Ethical use of AI generative tools in writing

AI IN PEER REVIEW – CURRENTLY GENERALLY A “NO”

- Editors and publishers are pretty aligned in thinking that LLMs have no place in peer reviews.
- Considerations: the issue of confidentiality/intellectual property; need to respect the peer review process
- OTOH: Possible double standard? (as a reviewer, would you feel comfortable peer-reviewing an AI generated paper?)

L1e: PEER REVIEW PROCESS

paper 1

Policy guidelines that instruct editors and peer reviewers to maintain the confidentiality of peer review materials and prohibit the use of generative AI tools during the review process

Editors and Reviewers must uphold the confidentiality of the peer review process. Editors must not share information about submitted manuscripts or peer review reports with generative AI or LLMs such as ChatGPT. Reviewers must not use artificial intelligence tools to generate review reports, including but not limited to ChatGPT (Association for Psychological Science - Academic Association)

Editors and peer reviewers must not upload files, images or information from unpublished manuscripts into Generative AI tools. Failure to comply with this policy may infringe upon the rightsholder's intellectual property (Taylor and Francis - Publisher)

NIH prohibits NIH scientific peer reviewers from using natural language processors, large language models, or other generative Artificial Intelligence (AI) technologies for analyzing and formulating peer review critiques for grant applications and R&D contract proposals (National Institutes of Health - Federal Agency)

PROS: RESPONSE TO INCREASED WORKLOAD; LOCAL LLMS COULD HELP

Those in favor of using GAI argued that it is important to recognize that a review involves multiple tasks. From this perspective, GAI can be beneficial if used judiciously, supporting reviewers only on less intellectually demanding tasks. They maintain that such an approach ensures that critical thinking and intellectual judgement remain the exclusive domain of human reviewers. Other panelists (prevalently editors) expressed strong skepticism about the use of GAI in peer review, raising the issue that there is no solid evidence that GAI actually improves the quality of reviews (perhaps it is simply faster to have GAI review a manuscript). As one editor stated:

"There are many statements made by people about how all these tools are going to help us improve efficiency. And I think to me, those are all assertions that have yet to be validated."

A second concern relates to the potential breach of confidentiality when reviewers upload other authors' manuscripts to public GAI systems. This issue has drawn considerable criticism, as highlighted by the words of one editor:

"If you just upload a document [...] it would be a breach of confidentiality and a dissemination of somebody else's intellectual property."

Proponents of using GAI for reviews replied suggesting the possibility of relying on locally hosted GAI systems, instead of public ones, as a way to address concerns related to the breach of confidentiality. As one editor claimed:

"But there are other ways to use AI that can help [...] And if you use AI, there are local versions of AI, there is a tool called GPT for all. If you have a powerful enough computer, you can set this up in your office. And this is off the cloud, off the internet. So, it just stays in your office. And you can use it to bypass the confidentiality issue."

In response, skeptics claimed that using local GAI still requires the authors' informed consent, since the manuscript may still be used to improve the local GAI system. As one editor stated:

"But the people who wrote the paper were never asked if you could use their paper to train a system. You know, it's just the use of data without consent, basically. You train a system using their submission, even if there are no privacy issues you are still using someone's work to improve your own system"

As a result of different views, some editors have developed policies and transparency statements for reviewers, similar to those created for authors. These policies explicitly prohibit reviewers from uploading manuscripts to cloud-based public GAI systems and require them to disclose whether and how they used GAI during the process of writing the review. From this animated debate emerged a clear need to foster greater communication and collaboration across the whole academic community, with the aim of creating standards and common policies, and reinforcing trust, especially in light of the growing concerns not only about unethical behavior, but also fraudulent practices.

EXAMPLES FROM ACROSS THE SPECTRUM

- **Major AI conference flooded with peer reviews written fully by AI**
<https://www.nature.com/articles/d41586-025-03506-6>
- **Major conference catches illicit AI use — and rejects hundreds of papers**
<https://www.nature.com/articles/d41586-026-00893-2>
- **A conference for AI generated papers, with AI reviewers:**
<https://agents4science.stanford.edu/>
- **Focus track on the conference for Research Integrity (and a chance to provide feedback)**
