

MARCH 11 – RAG PRACTICE

Reminder of assignment from last class

If possible, install this package: <https://github.com/Future-House/paper-qa>

Think about a mini collection of papers you are familiar with (maybe 2-4) and a couple of research questions (whose answers you know) that you could ask to evaluate the software

Let's start by defining the task and adding it to our shared document:

- Which sources you want to use? (3-5 papers)
- What question(s) do you want to ask? (suggestion: at least one factual, one narrative)

Questions should be related to content in the papers, and something you know the answers to, so you can evaluate the answer.

I prepared two short demos that use OpenAI and Claude that I will upload.

Let me show you how it works.

We will focus on getting this done first, and then compare the results to two other tools.

Documentation is here (I needed a lot of troubleshooting, but hopefully I am now able to help):

<https://edisonscientific.gitbook.io/edison-cookbook/paperqa>

Homework

Add your task to the shared document

Run your PaperQA code and derive answers for your questions (keep it simple, if needed, in order to be able to index your sources).

Run exactly the same query (add same sources, ask same question) using NotebookLLM (Google) and your favorite chatbot (but add the sources as files).

Report on accuracy, ease of use, references, anything else you find to be relevant.
